

Overview of CE Hub Data Platforms

Crop Environmental Data Hub: weather data, insights, visualizations and APIs for Syngenta teams.

Portals

APIs

Insights

Pradeep Kethireddy & Irene Caramatti

A single access point for weather intelligence

CE Hub brings together historical, real-time and forecast weather data, then turns it into decision-ready services for field, agronomy and digital product teams.

Weather data

Historical, real-time, nowcast and forecast sources.

Self-service portals

Business-friendly access to query, export and subscribe.

System APIs

Programmatic access for digital products and applications.

Actionable insights

Spray windows, disease risk and alerting.

Choose the access route that fits the use case

Use portals for exploration and self-service workflows; use APIs when weather data or insights need to be embedded directly into applications.

Portals

Self-service UI for weather query, historical export, AgriAlert setup and visual review.

Gridded historical weather data

Hyper-local weather station data

AgriAlert subscriptions

CE Hub Swagger/API docs

APIs

Swagger and documented services for product integration and automation.

From long-term history to near-term decisions

CE Hub combines multiple provider and station sources to support decision-making at different time horizons.

Historical

Gridded datasets and station records dating back to 1940

Real-time

Current weather conditions and measurements where available.

Nowcast

Very short-term predictions for the next 0–6 hours.

Forecast

Short- and medium-range predictions for planning ahead.

Two complementary ways to work with historical weather

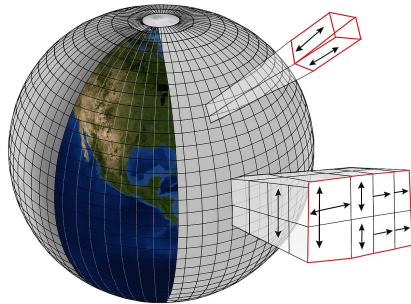

1. Historical gridded data

Records back to 1940

30+ datasets from providers such as ECMWF, DWD, NOAA and Meteoblue

Simulation, reanalysis and satellite-derived datasets

Variable spatial, temporal and coverage characteristics

Gridded portal

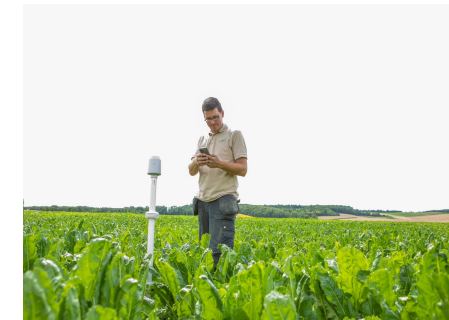

Historical API

2. Weather station data

170,000+ stations worldwide

- 30,000 Syngenta-owned stations at trial locations
- 140,000+ public stations from agencies

Temperature, precipitation, humidity, wind, pressure and more

Self-service portal

Station APIs

Forecasts for operational decisions

Short-range forecasts support immediate operational planning; medium-range forecasts help teams prepare for upcoming risk windows.

1–7 days

short-range forecast

7–14 days

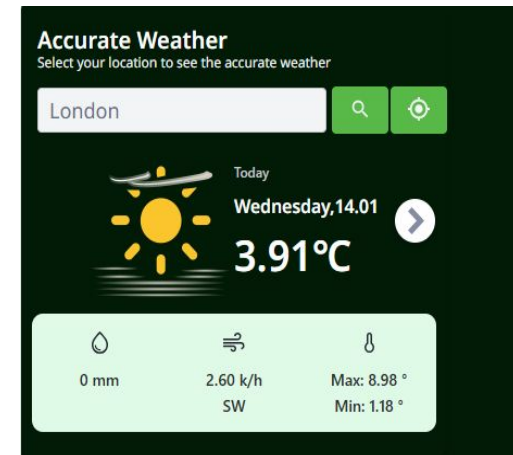

medium-range forecast

Predicted parameters

Temperature, precipitation, humidity, wind, solar radiation, cloud cover, pressure and derived evapotranspiration.

Global

coverage

Forecast visualization

Forecast APIs

Translate weather into agronomic decisions

CE Hub converts weather signals into recommendations that can be embedded in products, surfaced in portals or delivered as alerts.

Disease risk models

Indicate weather-driven disease pressure for supported crop/disease combinations.

Weather alerts

Notify teams when conditions cross defined thresholds or risk windows.

Spray windows

Support timing decisions by combining forecast data and operational rules.

Agronomic recommendations

Turn weather context into practical field guidance.
